“Using Experimental Animal Models to Study Stress Coping and Resilience”

by: Sarah Clinton, Associate Professor at School of Neuroscience, Virginia Tech

Dr. Clinton joined the faculty of Virginia Tech’s new School of Neuroscience in June 2016. Her research is broadly interested in the neurobiology of stress and stress-related disorders like depression and anxiety. She uses rodent models to study how genetic and environmental factors influence brain function, how individuals cope with stress, and why certain individuals may be more susceptible to stress-related disorders than others.

Thursday, January 26, 2017
3:30 P.M. – 4:30 P.M.

*Reception to Follow*

Location: Global Forum Conference Room, Suite 312, Kent Square Building
